

AAP-005 — AI Sitting at Discussion Tables

Human–AI Discussion as the Second AI Action Path

Abstract

Large Language Models made AI widely accessible through natural language. The next major Action Path begins when AI no longer serves merely as a question-answering system, but becomes a continuous participant in collaborative discussions.

AAP refers to this emerging paradigm as **AI Sitting at Discussion Tables**.

Here AI joins scientists, engineers, educators, designers, managers, and decision makers as an active participant in long-running conversations.

Knowledge is no longer produced by isolated prompts.

Instead, it emerges through continuous discussion, refinement, critique, verification, and collective learning.

This Action Path represents the transition from **AI as a tool** to **AI as a collaborative participant**.

Beyond Prompt Engineering

The first generation of LLM applications focused primarily on prompt-response interaction.

Prompt

↓

Answer

↓

End

This interaction pattern remains extremely valuable.

However, many real-world activities do not consist of isolated questions.

Research.

Engineering.

Architecture.

Education.

Policy.

Product design.

Scientific discovery.

These activities require continuous discussion rather than isolated responses.

AAP therefore considers Discussion Runtime to be a new Action Path rather than merely a different prompting technique.

The Discussion Table

AAP uses the term **Discussion Table** to describe an environment in which humans and AI jointly participate in an evolving conversation.

A typical Discussion Table includes:

- human participants,
- AI participants,
- shared documents,
- repositories,
- runtime knowledge,
- external evidence,
- accumulated decisions.

Unlike traditional chat sessions, the Discussion Table preserves continuity. Every discussion becomes part of an evolving knowledge structure.

Collective Learning Runtime

One important consequence follows naturally.

The primary product of the Discussion Table is no longer individual answers.

It is **Collective Learning**.

Discussion gradually produces:

- clarified concepts,
- improved terminology,
- refined architectures,
- reusable runtime knowledge,
- structural discoveries,
- engineering principles,
- research directions.

Knowledge therefore accumulates through interaction rather than isolated generation.

AAP views the Discussion Table as the first practical runtime for Human–AI Collective Learning.

AI as a Participant

Within a Discussion Table, AI performs many different roles.

Examples include:

- expanding ideas,
- reviewing arguments,
- identifying inconsistencies,
- proposing alternatives,
- organizing information,
- generating diagrams,
- drafting documents,
- explaining concepts,
- exploring possibilities.

The role continuously changes during discussion.

Instead of replacing human participants, AI increases the productivity of the entire discussion.

Discussion Creates New Action Space

The significance of the Discussion Table extends beyond collaboration.

It creates entirely new forms of AI participation.

Examples include:

- long-term research partnerships,
- collaborative software architecture,
- engineering design reviews,
- educational mentoring,
- policy discussions,
- interdisciplinary exploration.

These activities rarely fit into traditional benchmark evaluations.

Nevertheless, they create substantial real-world value.

AAP therefore considers Discussion to be a major expansion of AI Action Space.

Relation to Brain Units

Discussion Tables naturally lead toward Brain Units.

Continuous discussion gradually produces:

- persistent knowledge,
- reusable runtime assets,
- stable organizational memory,

- trusted execution patterns.

These accumulated structures eventually become components of Brain Units.

Discussion therefore serves as one of the primary growth mechanisms for future persistent AI systems.

Relation to HBD Evolution

The Discussion Table expands all three HBD dimensions.

Height increases because discussion improves reasoning.

Breadth increases because AI participates in more kinds of intellectual activities.

Depth increases because conversations become continuous rather than isolated.

Discussion therefore represents one of the most balanced Action Paths introduced in AAP.

Beyond Individual Intelligence

The long-term importance of Discussion Tables is not that AI becomes individually smarter.

Instead, humans and AI together become capable of solving increasingly complex problems through sustained collaboration.

The unit of intelligence gradually shifts from individual models toward collaborative runtime systems.

This transition represents one of the defining characteristics of Human–AI Civilization.

Key Takeaways

- Human–AI Discussion represents the second major AI Action Path.
- Discussion extends AI beyond isolated prompt-response interaction.
- Discussion Tables provide a runtime for Collective Learning.
- AI becomes an active participant rather than merely an answer generator.
- Continuous discussion accumulates reusable knowledge and structural assets.
- Discussion naturally contributes to the emergence of Brain Units.
- The Discussion Action Path simultaneously expands Height, Breadth, and Depth.
- Human–AI collaboration becomes a new form of collective intelligence rather than a collection of independent conversations.
